

Movie FAQ Chatbot

User Guide for the Interactive Movie Chatbot

1. Overview

Movie FAQ Chatbot is a Streamlit application that answers natural-language questions about movies in its included dataset. It supports individual movie details, rankings, and comparisons.

2. Start the Application

Open a terminal in the project folder, create a virtual environment, and install the dependencies.

```
python -m venv .venv
.venv\Scripts\Activate.ps1
pip install -r requirements.txt
python -c "import nltk; nltk.download('punkt'); nltk.download('punkt_tab')"
streamlit run app.py
```

Keep the terminal open while you use the app. Streamlit will display a local URL and usually opens it in your browser automatically.

3. Using the Chatbot

1. Type a question in the chat box at the bottom of the page.
2. Include a movie title for questions about a specific movie.
3. Press Enter and read the answer in the chat history.

Tip: Ask for multiple details at once: `Interstellar rating, runtime, and budget`.

4. Settings

Control	What it does
Model selector	Switches between the Hybrid and Naive Bayes intent-classification models.

Show Debug Info	Shows model, latency, predicted intent, confidence scores, and movie-match details.
Clear Chat	Removes the current conversation from the screen.

5. Example Questions

Goal	Example question
Movie information	What is the rating of Interstellar?
Multiple details	Titanic genre, rating, and runtime
Plot summary	What is Toy Story about?
Rankings	Show the top 5 highest-rated horror movies
Comparison	Compare Titanic and Avatar
Budget and revenue	Did Avatar make back its budget?

6. Tips and Troubleshooting

- Use official movie titles when possible; try a shorter title or corrected spelling if a match fails.
- For comparisons, provide at least two movie titles.
- For rankings, include a measure such as rating, revenue, budget, popularity, runtime, or vote count.
- Answers are limited to the included dataset.
- If Streamlit is not recognized, activate the virtual environment and run `pip install -r requirements.txt`.
- If NLTK reports missing data, rerun the NLTK download command above.
